Manas Ranjan Nilorout

Hyderabad, Telangana
me@manasranjan.dev

Work Experience

UiPath Robotics | New York, USA
Senior Software Engineer
March 2021 - Present

Osmosys Software Solutions Pvt Limited | Hyderabad, Telangana, India
Associate Software Engineer
Jan 2018 – Feb 2021

Contact Details

301 - D Block, Aakriti Esta, Tellapur
Hyderabad, 502032
Telangana
Ph: +91 8093773107

Key Skills

- Analyzing requirements and building conceptual and database design.
- Quickly produce well-organized, optimized, and documented source code.
- Debug existing source code and polish feature sets.
- Contribute to technical design documentation.
- Maintaining well written logs for quick problem identification.
- Good self-management skills, highly organized and able to prioritize.
- Proven ability to collaborate effectively in a team environment, fostering open communication and achieving shared goals and when necessary taking lead.
- Continuously learn and improve skills.

Technical Info

- **Programming languages**: Node.JS, JavaScript, TypeScript, JAVA, Python
- **Front-end Frameworks**: BootStrap, React.JS, SemanticUI
- **Database Systems**: MySQL, FireStore, SQLite, Postgres, Redis, MongoDB, AWS Athena…
- **Back-end Frameworks**: ExpressJS (Node.JS), AdonisJS (Node.JS), NestJS (Node.JS), Spring
- **Tools**: Git (Version control), Visual Studio Code, InteliJ, Workbench, DBeaver…
- **Operating system**: Mac, Linux, Windows
- **Services**: Mailgun, SlogErr, NSQ, Twilio, RabbitMQ, Mosquitto(MQTT Broker), ELK stack and many more.

Projects

Integration Services | UiPath | India
https://www.uipath.com/

Integration Services under UiPath portfolio is an API Integration Platform to virtualize APIs into unified data models that eliminate brittle, point-to-point connections. It lets you build production grade applications with customized Application Ecosystem, and you get a cost, scale and performance advantage.

MicroServices:

Autopilot[Code Owner]: An assistant, powered by GenAI and trained on proprietary data, exists to provide code suggestions for a custom scripting language. It can construct connectors from start to finish based on given instructions, significantly reducing the routine work required by the engineering team.

API Workflows[Code Owner]: A stateless architecture written in Node.JS for executing user given scripts in a lambda along with bunch of other features like queuing, scheduling, using sub formulas and much more operating as a DAG(Directed Acyclic Graph)

Connector Builder: A monolith base developed in JAVA for hosting elements(vendors) as connectors which can be plugged/replaced/removed as and when needed.

Responsibilities

- Started multiple initiatives to automate mundane engineering chores to reduce toil and improve productivity.
- SME for a stack called formulas/studio web which works as a DAG and automates processes based on several events.
- Contribute features and bug fixes to an existing monolith JAVA/Node.JS code base to enhance the performance factors keeping time complexities and optimal solutions in mind.
- Involve in designing solutions for a set of problems, and address them in multiple microservices to incorporate proper changes and to keep the code flow/contract intact.

Caleido | Osmosys | India

Caleido is a project for monitoring hotels and provides a wide range of services to the hotel management system. Starting from booking room service to customer dealing with room related stuff from the ease of his finger tips using the power of IoT(Internet of things). To achieve all these multiple microservices were created and put in place. The technology stack for this included Typescript, Angular 9, MySQL, MQTT, RabbitMQ, Elasticsearch, Logstash, Kibana, Prometheus and more.

Responsibilities

- Set up a base for each new requirement to kick-start with.
- Create microservices as and when needed to solve the specific problems.
- Come up with solutions considering the available stack to use and make it work.
- Help teams with technical issues and review their code.
- Constantly keep enhancing the code for better performance.

- Setup tools for monitoring servers or to get a birds eye view.

Technologies used,

- Node.JS(v12) with Typescript for server side programming.
- MQTT for communicating with remote devices.
- RabbitMQ for the queueing system.
- ELK stack for monitoring logs and other server related stats.
- MySQL and Redis for data related operations.

GlowRadius | Private | India
https://www.glowradius.com/

A B2B intent selling vendor that crawls digital footprint to gather useful insights on everyday crucial business activities and offers recipes(filters) to customers for collecting valuable information for driving their organizations towards success.

Responsibilities

- Lead efforts on designing the base framework and contribute towards making it optimal per customer use cases.
- Used technology stack like, Google Firestore, Google AppEngine for making sure that the performance is at its peaks at a cost of other factors.
- Contributed thoughts towards project planning and designing microservice led architecture for better performance and maintainability aspects.
- Did code reviews of peers to make sure the best of quality code is pushed to the production at all times, keeping the performance aspect in mind

Import.IO | Osmosys | United States
https://www.import.io/

Import.io is a product that allows businesses to extract data from various sources on the web and then transform that data to gather business insights. In the process of achieving the final results a bunch of AWS services(Athena, S3 storage, Lambda(serverless), Redshift) were used. As part of post processing different reports were generated after gathering, normalizing and analysing data from multiple sources.

Responsibilities

- Build extractors to crawl data from different web pages in similar format.
- Create tools that will be able to validate large volumes of data, filter out the odd ones and give stats out of it.
- Build solutions that will trigger the extractors and collect extracted data out of extractors and deliver to customers on desired platforms, or convert the data to visual demographics.
- Ensure the quality of data delivered to customers is always up to the mark.

Technologies used,

- Bunch of AWS services for different use cases.

    - S3 buckets for storing data
    - AWS Glue, Athena and Redshift as databases for data normalization.
    - Lamba and Serverless for different purposes.
- Node.JS and Python scripts for automating and validating large amounts of data.
- Looker as a tool for data visualization.

Counterpick | Osmosys | Sweden
https://counterpick.com/

Counterpick is a tool for League of Legends that can be described as an advanced form of the hand game Rock-paper-scissors. Counterpick does not care about the popularity or win-rate of a given champion. Instead, it takes every champion, their abilities and their style of play and compares them in a 5v5 match-up using a custom weighting system in order to predict the outcome of a game. Additionally, it tries to create team compositions that cover as many abilities as possible. If used correctly, Counterpick will help you create some really powerful team compositions (and some really off-meta ones as well).

Responsibilities

- Created APIs for several operations that are needed to be performed for maintaining and updating the server. These API components use ES6 features and are transpiled for use in Node.JS and the front-end using Babel.
- Wrote micro services using Node.JS to read data from excel files and inserts in databases.
- Made modifications to existing simulation components which simulate portal actions on the server side. Along with that implemented functionality to simulate bulk records from the database directly.
- In order to get more and more data for accuracy in simulations, I created one more component that will regularly hit RIOT servers and get data from there and store it in our server for bulk simulations.
- As visitors for this web application were mostly from EU region, so integrated few front-end and back-end functionalities for GDPR compliance like disabling and enabling ads, analytics and other cookies using VueJS and Cookiebot, and created an admin specific API that will allow admin to delete stored user details when needed.
- Mailgun integration for sending bulk emails.
- Used Winston logger to debug and identify issues quickly.

Technologies used,

- Node.JS: Back-end APIs, and components
- MariaDB / MySQL
- NSQ: Distributed messaging component
- VueJS: Front-end JavaScript framework for building user interfaces.

Common API | Osmosys | Hyderabad, Telangana India

Common API is an application built on top of AdonisJS framework (based on NodeJS) which is able to perform various generic tasks such as generating PDF file from a web-page or HTML string with needed customization(custom footer, custom margin, etc can be specified), manipulation of images like resizing image, cropping of image etc, generate excel sheet from a input data or read input data and generate excel sheet out of it with necessary customization using a token ID as authentication key.

Responsibilities

- Created APIs that will handle services provided by Common-API such as PDF generation, image manipulation etc.
- Created middle-wares that will be helpful for file handling, logging of service usage of services provided by common-api.
- Wrote test cases for automatic testing before integrating with stable code and making sure all the functionalities are working fine.
- Wrote a few scripts for ease of maintaining applications, such as to automatically delete generated files from time to time, send service usage statistics to developers etc.

Technologies used,

- Node.JS: Back-end APIs, and components(AdonisJS framework)
- MariaDB / MySQL

1Cricket | Private | India
http://1cricket.in/

1Cricket is a project for showing live cricket scores and putting bets on teams for virtual coins. The application collects the bet preferences of users and a result engine in the background does the calculation and gives results back with the appropriate amount of virtual coins.

Technologies used,

- Python for various cron operations/polling data from several sources
- Node.JS for the server

Awards and Achievements

- **Garuda Award:** Osmosys software solutions [2019]
  It's an award given to someone who performs extraordinarily throughout the year.
- **Pegasus Award**: Osmosys software solutions [2020]
  It is for someone who consistently demonstrated quality of work, commitment, hard work and jumped into taking responsibilities without hesitation.
- Participated in a couple of events in **IIT Kharagpur(Kshitij)** and won.
- Published a journal in **IJRAT** about *Performance analysis of wireless communication*.

Qualifications

Education

- **Gandhi Institute of Engineering and Technology** *[2013-2017]*
- **Talents College of Science and Technology** *[2011-2013]*
